

The online world is changing how we do business. Organizations need a tool that allows them to easily collaborate with co-workers and external parties, while protecting important information.

Facilitate collaboration

Our solution humanizes the exchange of data, allowing subscribers to organize information around people and context instead of files and folders. Subscribers upload their documents to our secure communications Channels, and grant access to the users of their choosing. Subscribers can also securely communicate in-app, helping them focus on the collaboration that's required to help a business grow.

Start realizing the benefits of a real-time cross-platform application. We support access from the majority of modern devices, including iPads, Android tablets and Blackberry Playbooks - ensuring subscribers are connected even while away from the office.

Choose secure file sharing

FTP services are often complicated and commercial grade file sharing solutions don't always provide the security required by regulated industries. Organizations need a way to share securely, without fear of confidential information being accessed by unintended recipients.

Security is paramount to our business - and we pass that along to our customers. TitanFile gives subscribers the same level of encryption

approved for the storing of classified information up to the Top Secret level by all US government agencies and departments.

While alternatives to TitanFile do exist in the marketplace, they're generally either easy to implement and insecure, or secure and difficult to implement. Organizations need a platform that provides the security they require, while also being easy to adopt for even the most elementary tech users.

Current digital alternatives to TitanFile include email, flash drives, online backup solutions and commercial grade file sharing providers. While each of these solutions may seem effective, there is always a risk. Not all email accounts are secure, physical hardware is susceptible to loss or theft and many solutions are often expensive or difficult to use. TitanFile mitigates these risks by providing a secure cloud computing application that creates a physical and logical separation between encryption, decryption and storage.

Applications

Online file sharing is a popular service required by organizations in an almost limitless amount of industries, including healthcare, finance, accounting and the legal field. With the legal regulations protecting the privacy and security of consumers becoming increasingly strict, more and more industries find themselves looking for a file sharing solution that protects their business and the interests of their clients.

Company summary

TitanFile was founded in 2011 by Milan Vrekic and Tony Abou-Assaleh with a goal of democratizing security. TitanFile currently maintains two offices. Our Halifax, Nova Scotia branch is home to our sales and marketing teams, while Waterloo, Ontario focuses on research and development.

Leadership

Tony Abou-Assaleh, PhD - President and CEO

Tony Abou-Assaleh is a cofounder and CEO at TitanFile Inc. Tony holds a PhD and a MMath in Computer Science. An ex-Googler, Tony's interests span the full-stack of running a startup from business growth opportunities and team building, to software development and system architecture.

Mark Dineen - CTO

Mark is a veteran tech leader with over ten years experience in compliance and privacy-sensitive application and data management. An expert in network and information security, Mark has directed organizations through certification and audits for HIPAA, PCI-DSS and many other regulatory frameworks. As TitanFile's CTO, Mark uses his expertise in software design and architecture to turn our roadmap into reality.

Greg Poirier - Senior Director, Marketing

In his role as Senior Director, Marketing, Greg oversees TitanFile's marketing and customer service strategies, with a focus on high revenue growth. Greg has over a decade of marketing experience in both B2B and B2C settings at the national and international level. Most recently he was part of the Radian6 team that was acquired by Salesforce to form the Marketing Cloud.
